Check ChestShop quantity and item matching with renamed stock

A shop may contain the right material but still reject a trade because the expected item has different metadata or the container cannot supply the advertised bundle.

Before you start

ChestShop connects a sign, stock container and economy account. Test the buyer and seller separately: permission to create a shop does not prove stock access or payment works. Read the installed release documentation before changing signs on public shops.

Work through the check

1. Copy one intended sale item into a test container and record its name, enchantments, damage and other visible properties.
2. Use the installed ChestShop item-identification method rather than guessing an old numeric item ID.
3. Count the advertised bundle and ensure the chest can supply that exact quantity without mixing different item variants.
4. Try a normal item first, then the intended customized variant, recording which one the shop recognizes and transfers.

What to compare

Keep the original custom item outside the shop while preparing samples. Compare material, quantity and metadata separately, and do not rename live stock repeatedly just to see whether the shop begins accepting it.

Confirm the result

Only the documented matching item should move, in the advertised quantity. The customer should not receive a substituted or partially missing bundle.

If the result differs

A custom-item plugin may store data beyond the visible name. Check its ChestShop integration before accepting valuable custom gear, and confirm the customer has room for the whole transaction.

Recover safely

Keep the original stock and sign description available while testing a replacement entry. If matching remains uncertain, suspend that item’s shop instead of stripping item metadata or deleting inventories.

Documentation and related help

Check the ChestShop maintainer documentation and ChestShop maintainer reference against your installed release before applying changes.
