Give a GriefDefender helper container access without full ownership

A storage helper should not automatically receive permission to manage the entire claim. Compare the documented trust or role controls with actual container behavior before promoting them.

Before you start

GriefDefender uses LuckPerms and claim-aware rules. Current documentation describes YAML by default with optional HOCON; check the format your server actually generated. Claim, parent and wilderness contexts matter, so record the location and affected player before changing rules.

Work through the check

1. Record the claim identifier, owner, parent context and the helper’s existing access using the installed release’s supported inspection controls.
2. Read the release’s trust and flag documentation and choose the narrow container-related access needed for the task, rather than an owner or administrative role.
3. Apply that grant to one ordinary test helper and try opening a disposable chest, using an ordinary interaction and attempting a harmless build action.
4. Check a second storage area or child claim to verify the grant does not cross the intended boundary, and confirm the helper cannot edit claim membership.

Confirm the result

The helper should reach only the intended storage and retain the expected build restrictions. They should not gain ownership transfer or claim-management authority through the storage grant.

If the result differs

Inherited LuckPerms groups, parent flags and player-specific overrides can add access independently. Inspect those sources before assuming the local trust menu is the only active rule.

Recover safely

Remove only the temporary grant and restore the recorded previous access if the result is broader than planned. Leave claim ownership, structures and other members unchanged while correcting the permission boundary.

Documentation and related help

Check the GriefDefender maintainer documentation and GriefDefender maintainer reference against your installed release before applying changes.
