Review EssentialsX command-disabled entries after a plugin change

A command can remain unavailable after its replacement plugin is removed. Check the disabled-command policy and registration logs before assuming the EssentialsX permission system is broken.

Follow the procedure

1. Identify the missing command and the plugin change that preceded the report. Record whether the player sees unknown command, no permission or a replacement plugin’s help.
2. Inspect the EssentialsX disabled-commands list and any server-level alias. Save the exact entries; a similar command name can be unrelated.
3. Confirm that the installed EssentialsX release actually provides the desired command. Read its command reference rather than relying on an alias remembered from another server.
4. Remove only the obsolete disabled entry in a controlled change. If command registration needs a restart, schedule one and keep the existing userdata folder unchanged.
5. Test the explicit command and its intended alias with a limited account that has the exact documented permission. Check a command that should remain disabled too.
6. Update menus or instructions that still point at the removed plugin’s syntax. Keep one documented command owner so later plugin changes do not recreate the ambiguity.

Check the result

The intended command should register and execute through EssentialsX, while unrelated disabled commands remain unavailable. Confirm the effect, not merely the presence of an autocomplete suggestion. An alias can route to a different provider even when the base command appears correct in help.

If the result is wrong

If the command remains unknown, inspect startup errors and the installed module rather than changing more permission nodes. Restore the saved disabled entry if the old replacement still handles the command. Do not reinstall EssentialsX or regenerate its data folder to resolve a single registration policy entry.
