Test Jobs Reborn break-and-place rewards for a money loop

A positive break reward can become exploitable when players replace the same block repeatedly. Test the configured protection and reward policy on a small sample before opening a mining job publicly.

Before you start

Jobs Reborn tracks job membership, experience and rewards as well as money payments. Use a test player with a recorded level and balance. Some actions depend on optional integrations, so identify the job file and event before editing rewards.

Work through the check

1. Copy the active job file and record the break and place entries for one inexpensive block, plus any relevant protection settings.
2. Prepare a controlled area where the test account can build, keeping naturally generated blocks separate from blocks placed during the trial.
3. Break one natural block and one player-placed block, recording money and job experience changes after each payout interval.
4. Repeat a short place-and-break cycle and compare its net return with your intended policy; inspect the current release’s block information tools if protection tracking is unclear.

Confirm the result

Natural gathering should pay as intended, while a repeat placement cycle should not produce an unintended profitable loop. Any placement penalty must be understood before players build

valuable structures.

If the result differs

Older troubleshooting examples can use material names from obsolete Minecraft versions. Match the current generated job example and installed protection behavior rather than copying an old block identifier.

Recover safely

Restore the previous reward entry or temporarily make the affected action nonpaying through documented settings while reviewing the exploit. Keep player balances and historical records intact for a measured reconciliation.

Documentation and related help

Check the Jobs Reborn maintainer documentation and Jobs Reborn maintainer reference against your installed release before applying changes.
